First M.J., McLaughlar C.J., Campbell M.L., Rogers G.E., Analysis of the Sheep Ericholyalin gene: potential structural and calcium-binding roles of trichohyalin in the hair follicle."; J. Cell Biol. 121:855-865(1994). MEDLINE-9326(0)18; PubMed-7684041; SECUENCE FROM N.A.

SEQUENCE OF 1016-1549 FROM N.A. STRAIN-MERINO-DOKSET JORN X BORDER LEICESTER; TISSUE-WOOL FOLLICLES;

MEDLINE-90140642; PubMed-2294812; Fielz M.J., Presland R.B., Roders G.E.: "The CDNA deduced amino acid sequence for trichohyalin, a differentiation marker in the hair follible, contains a 23 amino acid Cell Biol, 110:427-436(1990) repeat.";

, CONFIGURED AS A SERIES OF PEPTIDE REPEATS AND ARE THOUGHT TO FORM A SINGLE-STRANDED ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS, DOMAIN 6 IS THE MOST FEEBLAR AND MAY HIND KIE DIRECTLY BY TONIC INTERACTIONS DOMAINS 5 AND 7 ARE LISS WELL ORGANIZED AND MAY INDICE FOLDS IN THE MOLECULE, DOMAIN 9 CONTAINS THE C-LEMMINUS, CONSERVED AMONG ENTIRELY ALPHA-HELLICAL, OF VARYING REGULARITY DIFFERENT SPECIES.

- PTM: KNOWN SUBSTRATE OF TRANSGLUTAMINASE. SOME 200 ARGININES ARE PROBABLY CONVERTED TO CITRULLINES BY PEPTIDYLARGININE DEIMIDASE. SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE S-100 FAMILY.
- -!- SIMILARITY: CONTAINS 2 PF-HAND CALCIUM-BINDING DOMAINS.

```
The invention is directed to RAP2R polypeptides, RAP2R polynucleotide sequences and regulatory region located at the 3' and 5' ends of the MAP2B couldny region. The MAP2B polypeptides can be expressed by standard recombinant methodology. BAP2B polynucleotides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of BAP2B expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suffering from or susceptible to prostate cancer. Antibodies specific for the BAP2B polypeptides are useful in genetic analysis, the present sequence represents a protein encoded by a first cDNA sequence of the BAP2B gene consisting of the exons 1 to 45.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 DAPKDRELTFYNLADGIAEKERGEFTLFAGHLVKPFADTLXQVNISKTDEAFFDSENDPE 120

In gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the profesors the constitution of the full length cDNAs. The primers allow obtaining of the full length cDNAs casily without any specialised methods. AAH03166 to AAH18628 and AAH1863s to AAH8472 to present human cDNA sequences; AAH374 to AAH3852 to AAH3853 represent human amino acid sequences, and AAH3369 to AAH3832 to AAH3832 and AAH3843 represent human amino acid sequences, and AAH3369 to AAH3832 t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oliqoral primer and an oliqoral complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides of (b) a combination of an oligonucleotide comprises at least 15 nucleotides of (b) a combination complementary strand or a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide comprises a 1'-end sequence and an oligonucleotide comprising a sequence defined the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3' and sequence is selected from those defined in the specification. The primer sets can be used in antisense thereby and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT
```

```
The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human factal liver. The single exon nucleic acid probes may be used for predicting,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; foetal liver; geng expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sapt.
                                                                                                                                                                                                      The specification describes a method for the identification or detection of a microbe, using the gyrase quee as the index. The method involves the use of PCR primers to amplify DNA from the microbe, which is then identified or detected depending on its base sequence. The method can be used to classify and identify an unidentified microbe stain rapidly and with high precision. The present sequence represents a gyrase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of netwous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                        Human brain expressed single exon probe encoded protein SEQ ID NO: 33384.
measuring and displaying gene expression in samples derived from human tetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at itp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                probes which are derived from genomic sequences expressed in the human burde matrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

                                                                                                                                                                                                                                                                                                      q
                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to single even nucleic acid probes (SENP-see AAI315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antendfal diagnosis of human quentic disorders.
       Poptide #8214 encoded by probe for measuring placestal gove expression.

Ö
signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The protein and gene can be used to produce transgeric plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, indispot virus, pelargonium haf cul virus, rad clorar mettle virus, temato bushy stunt virus, fungi, including Phythophthora parasitic and Perchospora tabacia, bacteria such as Pseudomonas sytingae and P. Meloidogyue incounting aphids and lepidoptera and nematodes such as Meloidogyue incounting aphids and lepidoptera and nematodes such as organisms of maize.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of a rescued locus from the mutant Aspergilius oryzae P7 14.1, used in the method of the invention which involves the use of a mutant cell with a nucleic acid construct introduced into a locus. The methods can be used for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

This sequence is encoded by an Aspergillus organe DNA locus. The invention relates to a method of prodicing a polypeptide, comprising; (a) cultivating a mutant cell under conductive for production on the polypeptide, where: (i) the mutant cell is related to a parent cell. Which comprises a first DNA sequence encoding the polypeptide, by the introduction of a nucleic acid construct into the genome of the parent cell at locus which is not within the first DNA sequence, and not within a second ENA which encodes a protein that negatively regulates transcription, translation or secretion of the polypeptide, and not within a third DNA sequence encoding a protein that negatively regulates within a third DNA sequence, encoding a protein that cell and not within a the polypeptide under the conditions; and (ii) the mutant cell produces more of the polypeptide than the parent cell when both cells are cultivated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     under the conditions; and (b) recovering the polypeptide. The method is useful for producing polypoptides encoded by a LNA sequence which does not contain the mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0; Gaps

The present invention describes primer sets for synthesising 5602 full length coMs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonurcheotide complementary to the complementary strand of a polynneleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides, of (b) a combination of an oligonucleotide comprising a sequence complementary to the sequence and an oligonucleotide mapping a sequence complementary to the sequence and an oligonucleotide mapping a sequence comprises a 5'-end sequence and an oligonucleotide mapping a sequence of polynneleotide mapping a sequence of polynneleotide comprises a 3'-end sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in gone therapy. The primers are useful for synthesising polynocleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining on the full-length cDNAs casily without any specialised methods. AAR03165 to AAR13628 and AAR13647 to AAR13742 represent human clind sequences; and AAR1343 represent human amino acid sequences; and AAR1345 to AAR13332 represent oligomicleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the 5' end sequence/3' end sequence is selected from those defined in the specification. The primer sets can be used in antiscuse therapy and in gene therapy. The primers are useful for synthesising polynocleotides,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detrection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sdes to

Helicobacter pylori cellular proliferation protein #181.

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the converse their use in the discovery of movel antibiotics, the essential genes themselves and the discovery of movel antibiotics, the essential genes themselves and the discovery of movel antibiotics, the essential genes themselves and the checked proteins. The proteins are sendenced are considered to the protein antibiotic and Enferonce, and potential new targets for antibioris also useful for the identification of potential new targets of or antibiotic development. The antiscosmologic stress these proteins, and to obtain antibodies capable of binding to the express these proteins. The proteins can be used in proliferation, to express these proteins. The proteins can be used to screen compounds in alticular dispute in screen conformance. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an escential prokaryotic cellular proliferation protein.

Con the printed specifical on, but was obtained in electronic contraction in the printed specifical ion, but was obtained in electronic
